compliance with national regulations5 should also be checked by the Competent Authority.

The Competent Authority(ies) should ensure that the Ship Recycling Facility has established procedures for managing all wastes generated by recycling activity, which should be kept separate from recyclable materials and equipment and labelled and stored under conditions that do not pose a risk to workers, human health or the environment.

5.3 Other requirements

The Ship Recycling Facility should undertake all necessary steps to fulfil the requirements of applicable international and national legislation.

The Ship Recycling Facility should ensure that planned and conducted activities respect the limits set out in applicable national laws and regulations on land use where the Ship Recycling Facility is located and is operating.

5 Where such regulations are based on applicable international agreements, these should also be referenced.

Recycling Facility is located and is operating.

5 Where such regulations are based on applicable international agreements, these should also be referenced.

The Competent Authority(ies) may require an environmental impact study from Ship Recycling Facilities. In this case, the following guidance is to be considered.

A study may be conducted to assess the potential environmental impacts from the Ship Recycling Facility as a basis for identifying and prioritizing the Facility's environmental aspects. If a new Ship Recycling Facility is planned, the study may provide the basis to determine whether the location is appropriate and suitable for ship recycling activities. If the actual project involves a site already used for ship recycling or similar activities, the study may include an assessment of the environmental c onditions of the location. It is advisable to conduct the study during the planning stage and to initiate it as early as possible.

may include an assessment of the environmental c onditions of the location. It is advisable to conduct the study during the planning stage and to initiate it as early as possible.

The study may address in particular whether the Ship Recycling Facility has adverse effects on factors including, but not limited to, the following, and whether these effects are within

acceptable limits as defined by applicable international and/or national legislation:

flora and fauna of the specific area;

hydrogeology;

surface and ground water;

soil structure;

historical, cultural, social and economic values; and

air quality.

The study may focus particularly on the significant environmental effects of releases, identifying and quantifying the possible release of polluting substances into any media and their effects. Most attention might be paid to large-scale releases and releases of the more hazardous pollutants, which are likely to have most significant effects. Conversely, any releases at levels so low that they are unlikely to have any serious effects do not need to be

hazardous pollutants, which are likely to have most significant effects. Conversely, any releases at levels so low that they are unlikely to have any serious effects do not need to be assessed. However, consideration may be given to other substances capable of causing pollution in the same way.

The study may pay special attention to:

.1 Consumption and nature of raw materials:
Consideration may be given to options that use fewer resources or those that use materials that are less likely to create hazards or pollution risks;

.2 Waste issues:
Consideration may be given to the annual material flow, consisting of incoming ships for recycling and the resultant waste leaving the Facility. This may cover the types of waste that the Facility can receive and store, depending on the ships that the Facility is planning to recycle, and for each type:

- the maximum quantity that the Facility can receive;
- the maximum storage capacity for each type of waste; and
- the environmental hazards caused by waste during recycling activities and possible measures to mitigate the negative impact on the environment.

RESOLUTION MEPC.211(63)
Adopted on 2 March 2012

- the environmental hazards caused by waste during recycling activities and possible measures to mitigate the negative impact on the environment.

.3 Accidents:
Consideration may be given to the environmental hazards posed by possible accidents and their associated risks, including the practicality of measures to reduce risks and hazards and to respond to accidents; and

.4 Site restoration:
Consideration may be given as to whether there is a risk that the ship recycling operation will pollute the site, including planning in advance for decommissioning and restoring the site upon closure.

In some cases, a judgement will need to be made about the relative significance of different environmental effects. In making this comparison, certain basic parameters may help in reaching a conclusion. For example, long-term irreversible effects are worse than short-term reversible ones, if all other factors, such as immediate severity, are equal.

6 VERIFICATION OF DOCUMENTATION

reaching a conclusion. For example, long-term irreversible effects are worse than short-term reversible ones, if all other factors, such as immediate severity, are equal.

6 VERIFICATION OF DOCUMENTATION

The application, including its documentation, should be assessed and verified by the Competent Authority(ies). The assessment and verification should be concluded within a reasonable time frame, if possible within three months.

The assessment and verification process should include a site inspection, as described in section 7, after the documentation has been reviewed and evaluated.

If the application is rejected, the Competent Authority(ies) should inform the Ship Recycling Facility of the reason for the rejection.

7 SITE INSPECTION

Site inspections should be conducted at Ship Recycling Facilities. The Competent Authority(ies) is responsible for planning and undertaking the site inspection. The site inspection may involve, or use the guidance and reports of, local or national labour inspection services.

The main purpose of the site inspection is to check the consistency of the documentation

---CHUNK---

inspection may involve, or use the guidance and reports of, local or national labour inspection services.

The main purpose of the site inspection is to check the consistency of the documentation with the actual arrangements and operations at the Ship Recycling Facility.

The first site inspection should be announced in advance to the Ship Recycling Facility, in order to ensure that it will be possible to meet all relevant persons.

In advance of, during and following the site inspection, any necessary information should be provided by the Ship Recycling Facility.

Safety issues should be considered and sufficient precautions taken throughout the site inspection, including with respect to personal protection.

The inspection should address the functionality of arrangements established, focusing on safety and environmental protection and the handling of all materials including hazardous wastes and debris. The inspection should cover situations in which the Ship Recycling Facility is operating at maximum capacity with a full body of staff, including subcontractors.

The site inspection should verify that a SRFP exists and that it is being fully implemented.
